### **ABSTRACT**

Conducting research and publishing its results is crucial for a career in teaching. Doing research is only half of the picture. Its results need to be published so that other researchers can review and appreciate the value of the evidence generated. In this way, the body of knowledge can develop and grow scientifically. Further, the information technology has afforded practitioners, lecturers, researchers, students and other scholars the means to access, search, and share information increasingly with greater ease and speed. The technology has also helped in easing the processes of submission, review and time for the publication of scientific papers. These processes need to be introduced to novice writers so that they can cope with the demands of publication businesses. Along with the technical aspects of academic writing, the workshop for students and teachers in a small private campus is expected to generate productive outputs.

*Kata Kunci: Research, publishing, academic writing, body of knowledge*
