ABSTRACT

Ecoprint is a work of art for making textile products which is unique and special because the colors and shapes of the motifs produced are different from each other. The ecoprint technique is made by printing with materials found in nature such as fabric, dyes, or pattern makers. Ecoprint was chosen because it uses nature as an effort to reduce waste. The implementation of this ecoprint training uses a direct face-to-face method with lectures and questions and answers so that the material can be conveyed well to PKK mothers. This training produces textile products in the form of ecoprinted fabric which can open entrepreneurial insight for training participants.
