ABSTRACT

The achievements achieved by the Indonesian national team and football clubs in the region and internationally in the last 20 years can be said to be concerning. The system and pattern of managing youth coaching is at the root of the problem. The youth coaching system whose main implementation is SSB (football school) is still far from the process of coaching quality young players. This research aims to develop a performance assessment management software model of quality management SSB-based management on SSB Se-DIY. The research method used is the R and D (Research, Development) method. The 2021 target is composed of software that is able to help the implementation of the quality management system of football school management in the DIY province. This research produces software to assess the performance of SSB management more sparingly, effectively, and efficiently in its governance. Some shortcomings must be repaired continuously.
