## **ABSTRACT**

Number of early childhood in Indonesia is very large at around 10% of the entire population, then as a candidate for the next generation, the quality of growth and development of early childhood in Indonesia needs serious attention that gets good nutrition, stimulation of adequate and affordable quality health care including detection and early intervention developmental aberrations. In addition to these things, various environmental factors that can interfere with the growth and development of children must also be eliminated. This study aimed to describe the Knowledge Relations with the mother's role in the development of executive function kindergarten children Sedayu B in District Bantul, Yogyakarta.

The research method is analytic survey with cross sectional approach. Taken sample 50 mothers and children, using purposive sampling technique. Using alternative test chi square is Fisher's exact test. The results obtained in this study as many as 44 mothers (88%) have a good role and a good knowledge, 44 children (88%) have a good development and normal executive function. While 6 mothers (12%) less knowledgeable good but have a good role, there are 6 children (12%) with the development of executive function poorly but normal. Alternative test results obtained chi square  $p = 0.004$ .

The conclusion of this study is the relationship between knowledge with the mother's role in the development of executive function kindergarten children Sedayu B in District Bantul, Yogyakarta.

*Kata Kunci: Knowledge and the Role of Capital, Executive Function*
