

DEVELOPMENT OF ECOLITERATION PROGRAM FAMILY DEVELOPMENT SESSION : STRENGTHENING MULTILITARY FOR BENEFICIARIES FAMILY

by Sujarwo, Yoyon Suryono, Iis Prasetyo, Puji Yanti Fauziah, Erma Kusumawardani

ABSTRACT

This research was conducted as an effort to help improve community empowerment starting from the smallest group, namely the family. In addition to focusing on assisting government programs in poverty alleviation, this research also contributes to realizing the goals of sustainable development. The families referred to in this study are the beneficiary families of the family of hope program. The condition of the COVID-19 pandemic is a challenge for benefit families to be able to survive with the various changes that occur, including staying adaptable after losing their jobs or changing the amount of income used to meet their daily needs. This research using the RnD method was carried out for two years, in the second year this research focused on producing a learning model based on the results of empirical analysis of the target group. The result of the model development carried out in the second year is an ecoliteracy learning model as material development for beneficiary families. This model will be aimed at the companion of the family of hope program, who has a role in providing education to the beneficiary families. Ecoliteracy is an approach that is chosen based on the potential possessed by the target group. Because it focuses on the problem-solving abilities of beneficiary families, the learning approach used in this model is problem-solving learning. This approach is certainly based on adult learning that takes into account several aspects including the experiences of the target group.
