

Social Support Role Model Of Performance In Swimming Athlete : Self-Confident Mediator

by Fx. Sugiyanto, Agus Supriyanto, Nur Indah Pangastuti

ABSTRACT

Abstract

This study aims to examine the theoretical model of social support role to the performance swimming athlete through the mediator of self-confident. The hypothesis of this research is the theoretical model used to measure the performance athlete through self-confident mediator with empirical data. The population of this study is swimming athlete who follow the fun swimming championship 2019 in Yogyakarta. Sampling technique using purposive sampling. Samples in this study were 30 athletes consisting of athlete in age 10-12 years old. Data collection using scale and documentation. The data analysis uses the SmartPLS program to test the suitability of the measurement model with existing data in the field. The results showed Goodness of Fit (GoF) values: 0.271 can be used as a model used to measure individual performance through self-confident mediator in accordance with empirical data. The test results show that the social support role model is direct, positive and significant to the athlete's performance and there is a significant role model of social support for the employee through the mediator of self-confident. In conclusion, Effects of social support role model upon performance were therefore only apparent when attention was focused on the components of performance.
