ABSTRACT

This study aims to determine the pattern of distance learning by teachers of Physical Health and Sports Education in Elementary Schools in Yogyakarta. Sequential explanatory design is used with quantitative and qualitative research approaches that are carried out sequentially. The results are used to analyze the need for developing learning media that can be used online, offline and blended learning. From the analysis of existing learning patterns, it shows that most of the teachers at D.I. Yogyakarta has met the standards of distance learning implementation. However, the development of learning media on certain materials still needs to be done in supporting each material delivery activity carried out by the teacher. The survey results show that most teachers still use teaching materials in print or electronic form and existing learning videos. The results of in-depth interviews indicate that it is still necessary to develop learning media on the material of athletic activities, self-defense, physical fitness development activities, gymnastics, rhythmic motion, water activities, personal safety, and a healthy lifestyle. With the results of this analysis, it is hoped that it can provide ideas and inspiration for further research in developing learning media, especially Physical Health and Sports Education in elementary schools so that the goal of education towards the era of society 5.0 involving various technological developments can be achieved optimally both in emergency and normal conditions.
