

Student's Social Distancing Awareness and Born out Facing the COVID-19 Pandemic

by Sigit Sanyata, Suwarjo, Luthfita Cahya Irani

ABSTRACT

This article aims to explain the social awareness of distancing and born out among students when facing a COVID-19 pandemic. That the condition of panic can affect the psychological health of students, as well as restrictions on activities and social distance also triggers stress, anxiety and the appearance of symptoms of depression. On the other hand, students also attend lectures via online confronted with the dynamics of the problem both the platform used and the teaching strategy of the lecturer, so they are suspected of being born out. The data collection uses social distancing scale (SDS) and born out scale (BoS). The expected outcome of this study is to obtain a social distancing and born out awareness profile on students and to map the characteristics of students in two countries (Indonesia-Malaysia).
