### ABSTRACT

Educational program evaluation is an activity aimed at gathering information about an educational program, the results of which will be used by stakeholders to make decisions about the future of that educational program. In practice, most evaluation activities are often limited to gathering information and stopping at the recommendation stage. On the other hand, evaluation should be integrated with the decision-making process and the implementation of decisions for the improvement of the program itself, in order to enhance its performance. This research aims to develop an educational program development evaluation model, which, in its initial phase, involves producing the initial design of the evaluation model based on theories and field applications related to the development program evaluation model. The resulting evaluation model is obtained from a research and development (R&D) study. The research and development design used employs the Design-Based Research (DBR) model. The development evaluation model is suitable for application in complex and uncertain program situations. This model is intended to generate innovations so that program participants can follow and adapt to sudden and critical changes, enabling the program to run effectively.
