ABSTRACT:

There is a symptom of the weakness of pedagogic and professional competence in some physical education teachers, sports, and health, especially in old age teacher. It is characterized by physical education teacher who is older is difficult to follow the changes in the curriculum, lesson plans created with the old systematics, the teaching is still still the old way. The students were sent to get to know and master the basic techniques of sports skills. This study aims to determine the relationship of pedagogical competence and professional competence of teachers of physical education and sports health with age, as well as differences in pedagogic and professional competence in public and private school teachers.

This study was conducted by quantitative descriptive method, the data obtained using secondary data, which is associated pedagogical, professional competence, which is obtained from Yogyakarta city education office. Data were analyzed by comparison or difference test the competency of teachers by age using ANOVA statistical comparison of teacher competence as well as between the two categories of public and private schools with t-test. Test results of the correlation, both total competence with age, pedagogic competence with age, as well as teachers' professional competence with age, showed a significant difference. Successive $r = -0.143$, $r = -0.05$, $r = -0.173$. While the t-test results showed the p value for the value of professional, pedagogical, and a total of less than 0.05, there is a significant mean difference (for these values) between public and private schools. So public schools had a higher mean than private schools
